

NI Automotive Symposium 2010

NATIONAL INSTRUMENTS Automotive Symposium 2010

Automotive engineers face critical development and test challenges as the number of electronic components continues to increase. High end cars are made of more than 3000 parts that perform highly specified functions and contain up to 80 different electronic units to control sophisticated active subsystems. These not only include engine and steering components in brake systems for traction and stability control, but also numerous infotainment devices such as infrared cameras, radios and GPS receivers. Using traditional, fixed-functionality tools for design and test becomes more and more difficult as scientists and engineers continue to look for open and flexible solutions.

National Instruments provides advanced control and test platforms to rapidly **design, prototype and deploy new technologies**. These have been used in many applications to develop and improve automotive components and their production processes, resulting in a significant decrease of time-to-market.

With the Automotive Days, National Instruments will host an expert forum for the exchange of information on the latest technologies and products for designing, prototyping and testing automotive components.

The event will feature sessions on fundamental and advanced **topics in measurement and control technologies** presented by National Instruments technical experts, as well as **case studies** and **user solutions** presented by integration partners and experts in industry and research. During breaks you will be able to visit the **exhibition and network with colleagues and industry experts**.

The **NI Automotive Symposium** will be organized in **8 locations** throughout Eastern Europe.

Please find **further information** on the event at our local web sites in **your local language**.
